

# ***Annual Water Quality Report 2013***

## ***Highland Lake Water Service Area***

*Lake County Illinois Department of Public Works*

### **Purpose and Background**

This is the annual water quality report (or consumer confidence report) for the period of January 1 to December 31, 2012. Each year we will issue this report to provide information about the quality of our drinking water as well as details on the source of our water and what it contains. These reports are issued in compliance with the requirements of the Safe Drinking Water Act and are also intended to demonstrate our commitment to providing a safe and reliable supply of drinking water.

### **Water Quality**

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of certain contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the US Environmental Protection Agency's (USEPA) Safe Drinking Water Hotline at 1-800-426-4791.

To ensure that tap water is safe to drink, the Environmental Protection Agency prescribes limits on the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Your tap water quality is consistently monitored by the County and the Illinois Environmental Protection Agency (IEPA).

Water quality is judged by comparing your water to USEPA benchmarks for water quality. One such benchmark is called the Maximum Contaminant Level Goal (MCLG). The MCLG is the level of a contaminant in drinking water below which there is no known or expected health risk. This goal allows for a margin of safety. Another benchmark is a Maximum Contaminant Level (MCL). An MCL is the highest level of a contaminant that is allowed in drinking water. An MCL is set as close to an MCLG as feasible using the best available treatment technology. The MCL and MCLG are established by the USEPA.

**Public Participation...** If you have any questions about this report or about your water system please contact Austin McFarlane at 847-377-7500 or by email to [amcfarlane@lakecountyil.gov](mailto:amcfarlane@lakecountyil.gov). You may also visit the Lake County website at [www.lakecountyil.gov](http://www.lakecountyil.gov) to learn about opportunities for public participation at County Board meetings where decisions are made that affect drinking water quality. We always like to hear from our customers.

### **The Water Source, Treatment and Delivery System**

Your community is served by two groundwater wells, one located on North Circle Drive and the other on South Circle Drive. The wells are drilled into a water bearing limestone formation called an "aquifer" 300 feet below ground.

Four and six inch diameter water distribution piping interconnects the two wells and storage tanks to form a unified water supply and distribution system.

Este es un reporte importante sobre la calidad de su agua. Si usted no cuenta con alguien que pueda traducirle este reporte, llame al Lake County Department of Public Works al 847-377-7500 y con mucho gusto le asistiremos.

# Annual Water Quality Report 2013

## Highland Lake Water Service Area

### Contaminants Detected

Compound (Units)	Highest Level Found	Range of Detection	MCLG	MCL	Violation	Sample Date*	Probable Compound Source
Arsenic (ppm)	< 0.0005	< 0.0005 - < 0.0005	n/a	0.01	N	10/3/2012	Erosion of natural deposits.
Barium (ppm)	0.0341	0.0142 - 0.0341	2	2	N	10/3/2012	Erosion of natural deposits.
Chlorine (ppm)	1.4	0.78 - 1.4	MRDLG = 4	MRDL = 4	N	2012	Disinfectant used to eliminate bacteria.
Chromium (ppm)	< 0.005	< 0.005 - < 0.005	0.1	0.1	N	10/3/2012	Erosion of natural deposits.
Cyanide (ppm)	< 0.013	< 0.013 - < 0.013	0.2	0.2	N	1/6/2011	Erosion of natural deposits.
Fluoride (ppm)	0.875	0.864 - 0.875	4.0	4.0	N	10/3/2012	Erosion of natural deposits, added for dental health.
Iron (ppm)	0.199	0.167 - 0.199	n/a	1.0	N	10/3/2012	Erosion of natural deposits.
Manganese (ppm)	< 0.015	< 0.015 - < 0.015	n/a	0.15	N	10/3/2012	Erosion of natural deposits.
Mercury (ppm)	< 0.0002	< 0.0002 - < 0.0002	0.002	0.002	N	10/3/2012	Erosion of natural deposits.
Nitrate (as Nitrogen) (ppm)	0.118	< 0.05 - 0.118	10	10	N	7/3/2012	Erosion of natural deposits.
Nitrite (as Nitrogen) (ppm)	< 0.04	< 0.04 - < 0.04	1	1	N	7/3/2012	Erosion of natural deposits.
Combined radium (226/228) (pCi/L)	1.0	1.0-1.0	0	5	N	1/8/2009	Erosion of natural deposits.
Sodium (ppm)**	55.3	54.0 - 55.3	n/a	n/a	N	10/3/2012	Erosion of natural deposits.
Sulfate (ppm)**	177	145 - 177	n/a	n/a	N	10/3/2012	Erosion of natural deposits.
Total Haloacetic Acids (HAA5) (ppb)	1.69	1.69 - 1.69	n/a	60	N	6/1/2010	By-product of drinking water chlorination.
Total Trihalomethanes (TTHMs) (ppb)	1.1	1.1-1.1	n/a	80	N	6/1/2010	By-product of drinking water chlorination.
Zinc (ppm)	< 0.100	< 0.100 - < 0.100	n/a	5	N	10/3/2012	Erosion of natural deposits.

\* Some contaminants are sampled less frequently than once a year; as a result, not all contaminants were sampled for during the CCR calendar year. If any of these contaminants were detected the last time they were sampled for, they are included in the table along with the date that the detection occurred.

\*\* There is not a federal or state MCL for sodium or sulfate. Sodium Monitoring is required for information to consumers and health officials that are concerned about sodium intake due to dietary precautions.

Abbreviation	Definition
AL	Action Level is the concentration of a contaminant which, if exceeded, triggers treatment or other requirements.
MCL	Maximum Contaminant Level is the highest level of a contaminant that is allowed in drinking water.
MCLG	Maximum Contaminant Level Goal is the contaminant level below which there is no known or expected health risk.
n/a	Not Applicable
MRDL	The highest level of a disinfectant allowed in drinking water.
MRDLG	The level of a drinking water disinfectant below which there is no known or expected risk to health.
NTU	Nephelometric Turbidity Units is a measure of water clarity.
pCi/L	pico Curies per liter.
pos/month	The maximum number of positive samples collected in a calendar month.
ppb	Parts-per-billion is also referred to as micrograms per liter (µg/L). Equivalent to one ounce in 7,812,500 gallons of water.
ppm	Parts-per-million is also referred to as milligrams per liter (mg/L). Equivalent to one ounce in 7,812 gallons of water.
TT	Treatment Technique refers to a required process intended to reduce contaminant levels in drinking water.

## Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. *Immuno-compromised* persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The USEPA and Center for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the USEPA Safe Drinking Water Hotline at 1-800-426-4791.

## Contaminant Sources in Drinking Water

Both tap and bottled water come from rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animal or human activity. Contaminants that may be present in untreated water include:

- Microbial contaminants such as viruses and bacteria can be naturally occurring or may come from sewage treatment plants, septic systems and live stock operations.
- Inorganic contaminants such as salts and metals can be naturally occurring or can result from urban storm water runoff, wastewater discharges, oil or gas production, mining, or farming.
- Pesticides and herbicides come from sources such as agricultural and residential storm water runoff.
- Organic chemical contaminants including synthetic and volatile organic compounds are by-products of industrial processes and petroleum production but can also come from gas stations, urban storm water runoff and septic systems.
- Radioactive contaminants can be naturally occurring or be the result of oil and gas production and mining activities.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Lake County Public Works is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information about lead in drinking water, testing methods, and steps to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or at <http://www.epa.gov/safewater/lead>.

## Lead and Copper

Compound (Units)	90th Percentile	# of Sites Over Action Level	MCLG	Action Level	Sample Date*	Probable Compound Source
Copper (ppm)	0.246	0	1.3	1.3	2012	Erosion of natural deposits;
Lead (ppb)	< 4	0	0	15	2012	Erosion of natural deposits; Corrosion of household plumbing.

## Violation Table

Violation Type	Violation Begin	Violation End	Violation Explanation
CCR Adequacy/ Availability/ Content	7/1/2012	4/19/2013	The Annual Water Quality Report provided to you in 2012 by Lake County did not include the Source Water Assessment prepared by the IEPA, which is intended to inform you of the risks from exposure to contaminants detected in our water. The 2013 Water Quality Report does include this information.

## Source Water Assessment

To determine Highland Lake Subdivision's susceptibility to groundwater contamination, the following document was reviewed: a Well Site Survey, published in 1991 by the Illinois EPA. Based on the information obtained in this document, there are three potential sources of groundwater contamination that could pose a hazard to groundwater utilized by Highland Lake Subdivision's Community Water Supply. These include an open dump, a hardware store, and a septic system. In addition, information provided by the Leaking Underground Storage Tank and Remedial Project Management Sections of the Illinois EPA indicates on site with on-going remediation that might be of concern. Based upon this information, monitoring conducted at the wells, and available hydrogeologic data on the wells, the Illinois EPA has determined that the Highland Lake Subdivision's source water obtained from well #3 is not susceptible to contamination. Water obtained from well #2 is not susceptible to synthetic organic compound contamination; however, it is susceptible to volatile organic compound contamination. The land use within the wellhead protection area was analyzed as part of this susceptibility determination. This land use includes residential properties.
